

Leased lines: the benefits

Having access to a fast, reliable internet connection is now critical to most business operations. We rely on our connectivity to enable us to work from cloud-based apps. We need the internet to respond to email enquiries. We even need an internet connection to answer the phone.

Without a fast, reliable internet connection, your business is sure to suffer from reduced productivity. Even the smallest amount of downtime can have a significant impact on your bottom line.

What are leased lines?

A leased line makes the most of fibre optic cables to transmit a high-speed internet connection straight into your business.

Unlike traditional FTTC or FTTP lines which connect your business to the exchange, a leased line is a connection available exclusively to your business.

connection with others. This means that you can enjoy 100% of the upload and download speeds.

investing in leased lines?

What are the advantages of

Businesses that rely on internet connectivity to remain operational are increasingly turning to leased line connections. This is because they have many advantages over other business broadband connections.

The main benefits of investing in leased lines

With leased lines connections, you are

You have a better Service Level

Agreement with leased lines

more likely to benefit from an enhanced service level agreement (SLA). Any network faults will be fixed quicker

as your SLA will typically state that any line rentals are refunded if you experience extended periods of downtime. You are also far less likely to experience any faults when compared to typical broadband services – and any faults that do arise are fixed quickly.

With a leased line connection, you can guarantee that your upload

and download speeds are

They offer symmetrical

bandwidth

mirrored.

This is important because traditionally, broadband connections have prioritised download speeds which can

data. If your business is working from cloud-based solutions, then you need to upload data to your cloud-based applications, send

large emails or documents, answer

VoIP phone calls or even make

limit your ability to upload

video conferencing calls seamlessly and without any disruption.

Unlike typical broadband services that may have a cap on data limits as part of their fair

usage policies, businesses with

There are no data

restrictions in place

leased lines can benefit from unrestricted data caps. This can be essential for large businesses who need to upload large document sizes, or those working with data-heavy

software programmes. You are in control over your leased line, which allows you to determine any data

restrictions.

You are guaranteed fast speeds thanks to uncontended bandwidth

With a leased line, you are guaranteed

not sharing the bandwidth with anyone

fast internet speeds because you are

else in your local area. Your

internet speeds will not be

affected by any 'peak time' usage issues.

They are perfect for businesses working across multiple locations

Leased lines are an ideal

solution for businesses working across dispersed locations such as different offices. This is because you have greater bandwidth capabilities to cope with increased video calling and other types of communications.

It's also an effective solution for businesses looking to implement remote working. Home PCs and laptops can connect to the line, offering greater reliable internet connectivity. You're confident that your staff is working as

wherever they are.

productively as possible
